第一章

Getting started

This starter follows WisdomFusion's 'progbookcn' layout for programming and technical books. Replace the sample chapters with your own material; the class provides the title-page, chapter, heading, code-listing, and framed-box styles.

1.1 A documented workflow

Keep one chapter per file as a project grows. Cross-references, tables, and code listings can be added without changing the page geometry.

Key point

Use the bundled class as the visual foundation, then edit the class only when a project-wide style decision is needed.

</> 代码 1.1: A small example

```
def greet(name):
    return f"Hello, {name}!"
```

第二章

A second chapter

The upstream project also contains Chinese and article-oriented variants. This starter replaces its restricted fonts with the free TeX Gyre and Fandol families supplied by TeX Live.

2.1 Next steps

Add front matter, parts, appendices, and an index as the manuscript develops.
